

DTSC 3601: Data Science Studio 3: Predictive Analysis & Their Impacts

Initial Demo

Deadline: Tuesday, September 29, 2026 at 10 a.m. ET

As long as the task is open on Canvas, you will be able to modify your answers (only the last submitted answer will matter).

Task (20 points):

Submit the following to Canvas as a video file:

- In the Zoom app, click “new meeting”
- At the bottom of the screen are 3 dots within a circle (“More”). Click that and choose “record”
- You can record to the cloud (you will get a link to your video as an MP4 file by email after 30 minutes to an hour) or you can click “record to this computer” where it will be stored locally
- Click “stop recording” then restart recording to create a small video. You can also edit videos on iMovie or similar.
- Turn on “screen share”
- Then show your initial demo:
 - Show how your data is being ingested
 - Show where your data is being stored
 - Explain what data is being stored (specific features and why you chose these features)
 - Show how your data is used, or will be used to train a model
 - Show the predictions of your model when they receive ideal data

Submit the following to Canvas as a PDF file:

- What is the motivation for your AI model
- Why you chose to train your model on the data you chose
- What is the output of your model, specifically is it a classifier or regression model, and what the number or class represents. For example, temperature or humidity if this were a weather app.
- What steps you have completed in your demo
- What steps do you need to complete before the end of the semester for the demo to be ready

This will be **around 1/2 page**
